

Josephine Lee, Shuprovo Sikder

So What is the Hill Cipher?

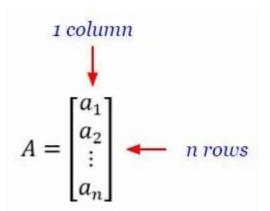

- Invented by Lester S. Hill
- It's the first polygraphic substitution cipher that could operate on more than three characters at the same time
- It's heavily rooted in linear algebra (matrix algebra) which makes it difficult (especially at higher dimensions) to compute by hand but fast for computers
- Considered the bridge between classical and modern cryptography

Hill's 6-dimensional encrypting/decrypting machine

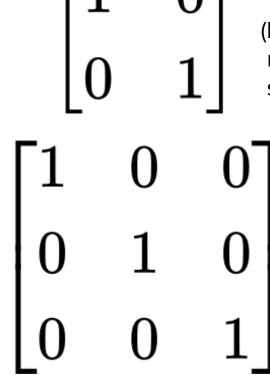

Matrices

N-Component Matrix:

(Just a matrix with one column and any number of rows)

Square Matrix:

(Notice how the number of rows and columns are the same!)

Matrices cont.

Matrix Multiplication (Dot Product):

$$\begin{bmatrix} a_1 & a_2 & a_3 \\ a_4 & a_5 & a_6 \\ a_7 & a_8 & a_9 \end{bmatrix} \begin{bmatrix} b_1 & b_2 & b_3 \\ b_4 & b_5 & b_6 \\ b_7 & b_8 & b_9 \end{bmatrix} = \begin{bmatrix} c_1 & c_2 & c_3 \\ c_4 & c_5 & c_6 \\ c_7 & c_8 & c_9 \end{bmatrix}$$

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} x \\ y \end{pmatrix} = \begin{pmatrix} ax + by \\ cx + dy \end{pmatrix}$$

Matrix Inverse:

Inverse of a Matrix

If
$$A = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$

$$A' = \frac{1}{ad - bc} \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$$

$$AA' = \begin{pmatrix} 1 & 0 \\ 0 & 1 \end{pmatrix}$$
Identity matrix

Inverse of a Matrix

$$A^{-1} = \frac{1}{|A|} \cdot Adj A$$

Hill Cipher: Encoding

- The Hill cipher is a polygraphic substitution cipher based on linear algebra
- To **encrypt** a message:
 - Each block of n letters (considered as an n-component vector) is multiplied by an invertible n × n matrix, against modulus 26.
- To decrypt the message:
 - Each block is multiplied by the inverse of the key matrix used for encryption.
- The matrix used for encryption is the cipher key, and it should be chosen randomly from the set of invertible n × n matrices (modulo 26).

Let's encrypt the message "CIPHER" with the following key: BELL

Letter ABCDEFGHIJK L M N O P Q R S T U V W X Y Z

Number 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25

Thus, the key can be represented as the following matrix:

$$\begin{pmatrix} B & E \\ L & L \end{pmatrix} \longrightarrow \begin{pmatrix} 1 & 4 \\ 11 & 11 \end{pmatrix}$$

The message "CIPHER" can be represented as the following matrix:

$$\binom{C}{I}\binom{P}{H}\binom{E}{R} \longrightarrow \binom{2}{8}\binom{15}{7}\binom{4}{17}$$

Next, we take the key matrix and multiply it by the first vector. Then we take the modulo 26 of the resulting matrix.

$$\begin{pmatrix} 1 & 4 \\ 11 & 11 \end{pmatrix} \begin{pmatrix} 2 \\ 8 \end{pmatrix} = \begin{pmatrix} 1 \cdot 2 + 4 \cdot 8 \\ 11 \cdot 2 + 11 \cdot 8 \end{pmatrix} = \begin{pmatrix} 34 \\ 110 \end{pmatrix}$$
$$\begin{pmatrix} 34 \\ 110 \end{pmatrix} \mod 26 = \begin{pmatrix} 8 \\ 6 \end{pmatrix}$$

We continue this process with the rest of the 2x1 matrices.

$$\begin{pmatrix} 1 & 4 \\ 11 & 11 \end{pmatrix} \begin{pmatrix} 15 \\ 7 \end{pmatrix} = \begin{pmatrix} 43 \\ 242 \end{pmatrix} = \begin{pmatrix} 16 \\ 8 \end{pmatrix} \mod 26$$
$$\begin{pmatrix} 1 & 4 \\ 11 & 11 \end{pmatrix} \begin{pmatrix} 4 \\ 17 \end{pmatrix} = \begin{pmatrix} 72 \\ 231 \end{pmatrix} = \begin{pmatrix} 20 \\ 23 \end{pmatrix} \mod 26$$

We convert these matrices composed of numbers into matrices composed of letters.

Letter ABCDEFGHIJK L M N O P Q R S T U V W X Y Z Number 0 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25

$$\begin{pmatrix} 8 \\ 6 \end{pmatrix} \begin{pmatrix} 16 \\ 8 \end{pmatrix} \begin{pmatrix} 20 \\ 23 \end{pmatrix} \longrightarrow \begin{pmatrix} I \\ G \end{pmatrix} \begin{pmatrix} R \\ I \end{pmatrix} \begin{pmatrix} U \\ X \end{pmatrix}$$

Thus, our encrypted message is "IGRIUX".

Hill Cipher: Decoding Example

So we just encrypted CIPHER with the key BELL and got IGRIUX.

Let's try working backwards and decrypting this.

$$\begin{pmatrix} I \\ G \end{pmatrix} \begin{pmatrix} R \\ I \end{pmatrix} \begin{pmatrix} U \\ X \end{pmatrix} \longrightarrow \begin{pmatrix} 8 \\ 6 \end{pmatrix} \begin{pmatrix} 16 \\ 8 \end{pmatrix} \begin{pmatrix} 20 \\ 23 \end{pmatrix}$$

Hill Cipher: Decoding Example

When we encoded, we had to do matrix multiplication with the key, but to undo multiplication, we must find an **inverse matrix** of the key (specifically modulo 26).

Key:
$$K^{-1} = d^{-1} * \operatorname{adj}(K)$$
 Adjugate Matrix:
$$\begin{pmatrix} 1 & 4 \\ 11 & 11 \end{pmatrix} = \begin{pmatrix} 1 & 1 & 1 \\ det \begin{pmatrix} 1 & 4 \\ 11 & 11 \end{pmatrix} & \operatorname{mod} & 26 = 19 \\ (19*1) & \operatorname{mod} & 26 = 19 \\ (19*2) & \operatorname{mod} & 26 = 12 \\ (19*3) & \operatorname{mod} & 26 = 1 \end{pmatrix} = \operatorname{adj}(K) = \begin{pmatrix} 1 & -4 \\ -11 & 1 \end{pmatrix} = \begin{pmatrix} 11 & 22 \\ 15 & 1$$

Hill Cipher: Decoding Example

So we find the inverse of our key BELL. Now we just multiply our enciphered text with this inverted key and we should have our plaintext!

$$K^{-1} = 11 * \begin{pmatrix} 11 & 22 \\ 15 & 1 \end{pmatrix} \mod 26 = \begin{pmatrix} 17 & 8 \\ 9 & 11 \end{pmatrix} \qquad \begin{pmatrix} 2 \\ 8 \end{pmatrix} \begin{pmatrix} 15 \\ 7 \end{pmatrix} \begin{pmatrix} 4 \\ 17 \end{pmatrix}$$

$$\begin{pmatrix} 17 & 8 \\ 9 & 11 \end{pmatrix} \cdot \begin{pmatrix} 8 \\ 6 \end{pmatrix} = \begin{pmatrix} 184 \\ 138 \end{pmatrix} \mod 26 = \begin{pmatrix} 2 \\ 8 \end{pmatrix} \qquad \qquad \downarrow$$

$$\begin{pmatrix} 17 & 8 \\ 9 & 11 \end{pmatrix} \cdot \begin{pmatrix} 16 \\ 8 \end{pmatrix} = \begin{pmatrix} 336 \\ 232 \end{pmatrix} \mod 26 = \begin{pmatrix} 15 \\ 7 \end{pmatrix} \qquad \qquad \begin{pmatrix} C \\ I \end{pmatrix} \begin{pmatrix} I \\ P \end{pmatrix} \begin{pmatrix} E \\ R \end{pmatrix}$$

$$\begin{pmatrix} 17 & 8 \\ 9 & 11 \end{pmatrix} \cdot \begin{pmatrix} 20 \\ 9 & 11 \end{pmatrix} \cdot \begin{pmatrix} 20 \\ 23 \end{pmatrix} = \begin{pmatrix} 524 \\ 433 \end{pmatrix} \mod 26 = \begin{pmatrix} 4 \\ 17 \end{pmatrix}$$

Hill Cipher: Weakness/How to Break it

- Since the Hill cipher is based on linear algebra, you can treat problems like a system of equations
- If you know the full plaintext or even just a piece of the plaintext and know the ciphertext, you can reasonably figure out the key!
- The partial plaintext must be of size n² (n being the number of rows/columns in the key matrix)
- You may not always be able to break the cipher! Results vary wildly depending on the plaintext you know.

Hill Cipher: Challenges (1)

- 1. Encrypt the following (by hand): **HATS** with the key: FINE
- 2. Encrypt the following: **CHALLENGES** with the key: WORD
- 3. Encrypt the following (from *The Lord of the Rings*):

WHENMRBILBOBAGGINSOFBAGENDANNOUNCEDTHATHEWOULDSHORTLYBECELEBRATINGHISELEVENTYFIRSTBIRT HDAYWITHAPARTYOFSPECIALMAGNIFICENCETHEREWASMUCHTALKANDEXCITEMENTINHOBBITONBILBOWASVERY RICHANDVERYPECULIARANDHADBEENTHEWONDEROFTHESHIREFORSIXTYYEARSEVERSINCEHISREMARKABLEDISAP PEARANCEANDUNEXPECTEDRETURNTHERICHESHEHADBROUGHTBACKFROMHISTRAVELSHADNOWBECOMEALOCA LLEGENDANDITWASPOPULARLYBELIEVEDWHATEVERTHEOLDFOLKMIGHTSAYTHATTHEHILLATBAGENDWASFULLOFT UNNELSSTUFFEDWITHTREASUREANDIFTHATWASNOTENOUGHFORFAMETHEREWASALSOHISPROLONGEDVIGOURT OMARVELATTIMEWOREONBUTITSEEMEDTOHAVELITTLEEFFECTONMRBAGGINSATNINETYHEWASMUCHTHESAMEAS ATFIFTYATNINETYNINETHEYBEGANTOCALLHIMWELLPRESERVEDBUTUNCHANGEDWOULDHAVEBEENNEARERTHEM ARKTHEREWERESOMETHATSHOOKTHEIRHEADSANDTHOUGHTTHISWASTOOMUCHOFAGOODTHINGTSEEMEDUNFAI RTHATANYONESHOULDPOSSESSAPPARENTLYPERPETUALYOUTHASWELLASREPUTEDLYINEXHAUSTIBLEWEALTH

with the key: RING

4. Decrypt the following: **LNNNTAVDZNAX** with the key: BELL

Hill Cipher: Challenges (2)

5. Decrypt the below text with the key BELT:

MGLFXWVEYWCPTVVEQNSRYWWTVBBTTFLKVEYXSBHLEFQLMEHDYXQXQKU MJOHZRYXXYEHDEFHNMGHAWBXXYVSHESXHBHGHPLUDTBIXUZSBYINNTMU DGUFWQNHZTBQILXVEYWESHDRNVBRNRJPCYEZSVEMRKXUGGHIPHZXIIXYWO

6. Break the following:

Ciphertext: FUPCMTGZKYUKBQFJHUKTZKKIXTTA

Known text: FTHE

Offset: 18

Solutions to Challenges (1)

1. Encrypted message: **JERQ**

Encrypted message: HXFHYKYSEG

3. Encrypted message:
